PINSOLE STELLITIES INCOCYTEES.

OF modified an active actives. The chromophore is formed upon cyclication of the residues. The chromophore is formed upon cyclication of the residues Ser-dehydroTyv-Gly.

BIOTECHNOLOGY: Has become a useful and ubsiquitous tool for making chimeric proteins of GFP linked to other proteins tool for making functions as a fluorescent protein tag. GFP tolerates N-and C-terminal fusion to a broad variety of proteins. It has been expressed in bacteria, yeast, slime mold, plants, prosophila, zebrafish, and in mammalan cells. As a noninvasive fluorescent marker in living cells, it allows for a wide range of applications where it may function as a cell lineage tracer, reporter of gene
                                                                                                                                                                                                                   [7]

**RAY CRYSTALLOGRAPHY (2.5 ANGSTROMS) OF MUTANT WITH YELLOW EMMISSION.

- I- FUNCTION: TRIFFUNCTIONL ENZYME BEARING THE GLN AMIDOTRANSFERASE

- GATASED, DOWAIN OF ANTHRAULATE SYNTHASE, INDOLE-GLYCEROLPHOSPHATE

SYNTHASE, AND PHOSPHORIBOSYLANTHRANILATE ISOMERASE ACTIVITIES.

- CATALYTIC ACTIVITY: N. (5-phospho-beta-0-ribosyl) -anthranilate = 1-

- CATALYTIC ACTIVITY: 1-(2-arboxyphenylamino) -1-deoxy-D-ribulose 5-phosphate = 1-(indol-3-yl)glycerol 3-phosphate + CO(2) + H(2)O.

- CATALYTIC ACTIVITY: (Cariborate + L-glutamine = anthranilate + pyruvate + L-glutamate.

- CATALYTIC ACTIVITY: Chorismate + L-glutamine = anthranilate + pyruvate + L-glutamate.

- PATHWAY: Tryptophan biosynthesis; first step.

- PATHWAY: Tryptophan biosynthesis; fourth step.

- PATHWAY: Tryptophan biosynthesis; fourth step.

- SIMILARITY: Contains 1 type-1 glutamine amidotransferase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SECURINCE OF 1-69 AND 392-433 FROM N.A.

Isold=260841-3; Sequence=VSP 005578;

-1 TISSUE SPECIFICITY: The major isoform 1 is neuron-specific. It is abundantly produced during brain ontogenesis by the Cajal-Retzius cells and other pioneer neurons located in the telencephalic marginal zone and by granule cells of the external granular layers of the cerebellum. Expression is located in deeper layers in the developing hippocampus and olfactory bulb, low levels of expression are also detected in the immature striatum. At early developmental stages, expressed also in hypothalamic of ields, tectum and spinal cord. A moderate to low level of expression occurs in the septal area, striatal fields, habenniar nuclei, some thalamic nuclei, particularly the lateral geniculate, the retina and some nuclei of the reticular formation in the central field of the medulla. Very low levels found in liver and kidney. No expression in radial glial cells, cortical plate. Purkinje cells and inferior olivary neurons. The minor isoform 2 is only expressed in non neuronal cells. The minor isoform 3 is found in the same cells as isoform 1, but is almost undetectable in retina and brain stem.

Expression increases up to birth and remains high from post-natal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             spinal cond, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors VLDLR and ApoER2 induces tyrosine phosphorylation of Dabl and modulation of Tau phosphorylation.

Expression declines thereafter and is largely brain specific in the adult.
-!- DOMAIN: The basic C-terminal region is essential for secretion.
-!- PTM: N-glycosylated and to a lesser extent also O-glycosylated.
-!- DISEASE: Defects in reln are the cause of the autosomal recessive reeler (rl) phenotype which is characterized by impaired motor coordination, tremors and ataxia. Neurons in affected mice fail to reach their correct locations in the developing brain, disrupting the organization of the cerebellar and cerebral cortices and other
                                                                                                                                                                                                                                                                                                                                       "Evolutionarily conserved, alternative splicing of reelin during brain

Exp. Neurol. 156:229-238 (1999)

-:- FUNCTION: Extracellular matrix serine protease that plays a role in layering of neurons in the cerebral cortex and cerebellum. Regulates microtubule function in neurons and neuronal migration. Affects migration of sympathetic preganglionic neurons in the spinal cord, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors VLDLR and ApoER2 induces tyrosine phosphorylation of Dab1 and modulation of Tau phosphorylation (By similarity).

-:- SUBUNIT: Binds to the ectodomains of VLDLR and ApoER2 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SIMILARITY).
DISBASE: Defects in Reln are the cause of creeping, which is characterized by tremor, gait ataxia, cerebellar hypoplasia and abnormal neuronal migration (particularly in the cerebral cortex and hippocampus). The mutation is due to a nucleotide insertion at codon 1892 which results in a translational frameshift and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isoid=PS8751-3; Sequence=VSP_005580; TISSUE SPECIFICITY: Abundantly produced during brain ontogenesis by the Cajal-Retzius cells and other pioneer neurons located in the telencephalic marginal zone and by granule cells of the external granular layer of the cerebellum.

DOMAIN: The basic C-terminal region is essential for secretion (By

-!- FUNCTION: This magnesium-dependent enzyme catalyzes the hydrolysis of ATP coupled with the translocation of calcium from the cytosol of ATP coupled with the translocation of calcium to the sarcoplasmic reticulum lumen. Contributes to calcium to the sarcoplasmic reticulum lumen. Contributes to calcium to the sarcoplasmic reticulum lumen. Contributes to calcium By

                                                             (By Similarity).

SUBCELLULAR LOCATION: Integral membrane protein. Sarcoplasmic and endoplasmic reticulum.

SIMILARITY: Belongs to the cation transport ATPases family (P-type ATPases). Subfamily IIA.
            low calcium concentrations. Dephosphorylated PLN decreases the apparent affinity of the Arpsase for calcium. This inhibition is regulated by the phosphorylation of PLN (By similarity). SUBUNIT: Associated with sarcolipin (SLN) and phospholamban (PLN)
ENZYME REGULATION: Reversibly inhibited by phospholamban (PLN) at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (BY

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 65, Application US/09415765B
Sequence 65, Application US/09415765B
Patent No. 654662
GRNERAL INFORMATION:
APPLICANT: Anderson. David
TITLE OF INVENTION: Fusions of Scaffold Proteins with Random Peptide
TITLE OF INVENTION: Libraries
TITLE OF INVENTION: Libraries
TITLE OF INVENTION: Libraries
CURRENT APPLICATION NUMBER: US/09/415,765B
CURRENT FILING DATE: 1999-10-08
PRIOR APPLICATION NUMBER: 09/169,015
PRIOR PLING DATE: 1999-10-08

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                16 VELDGDVNGHKFSVSGEGEGDATYGKLTLKFICTT-GKLPVPWPTLVTTFSYGVQCFSRY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 28, Application US/09023946B
Patent No. 6670449
GENERAL INPORMATION:
APPLICANT: GERO MIESENBOCK, ET AL.
APPLICANT: GERO MIESENBOCK, ET AL.
TITLE OF INVENTION: HYBRID MOLECULES AND
THEIR USE FOR OPTICALLY DETECTING CHANGES IN
CELLULAR MICROENVIRONMENTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FEATURE:
OTHER INFORMATION: Description of Artificial Sequence: Synthetic gfp
OTHER INFORMATION: gene (Papillomavirusized)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        15.2%; Score 192.5; DB 4; Length 238; 25.2%; Pred. Patent No. 6670449

GENERAL INFORMATION:
APPLICANT: GERO MIESENBOCK, ET AL.

TITLE OF INVENTION: HYBRID MOLECULES AND
THEIR USE FOR OPTICALLY DETECTING CHANGES IN
CELLULAR MICROENVIRONMENTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Indels

NyAlternate names: gene trpG-trpC-trpF protein; glutamine amidotransferase
NyContains: anthranilate synthase (EC 4.1.3.27); indole-3-glycerol-phosphate synthase (EC 5;Species: Aspergillus niger
C;Species: Aspergillus niger
C;Date: 07-Sep-1990 #sequence revision 07-Sep-1990 #text_change 31-Mar-2000
C;Accession: S00643; A23979; E23979
